High Burnout Risk -> Provide Wellness Support	2,034	100%

SUGGESTION

Contrary to expectation, heavy reliance on AI may not translate into better academic outcomes. Institutions should teach effective AI usage and independent problem-solving together.

EXECUTIVE INSIGHT

1. Heavy AI usage does not automatically lead to poor academic outcomes.
2. Among sophomore STEM students with beginner prompt engineering skills, this subgroup recorded **no at-risk students** and **no high burnout cases** under the criteria.
3. High AI usage should be distinguished from unhealthy AI dependency.
4. Students can use AI extensively while maintaining strong academic performance and wellbeing.
5. Focus interventions on **AI dependency**, not AI usage alone.
